

CEREC RESTORATIONS

Digital dentistry

CEREC 3D

Here in Bachelors walk we are the only practice in Lisburn to have access to such advances in dentistry

Cerec Digital dentistry is a new way of restoring damaged teeth.

Up until now we had a limited choice of options for damaged teeth:

Amalgam “silver fillings” have been used safely for over 100 years but they offer no improvement in strength for a decayed or damaged tooth.

Composite (plastic) tooth coloured fillings look great and can add some strength while looking like a natural tooth but

beyond a certain size aren't strong enough

A crown can greatly improve the strength of a weakened tooth but involves several appointments and removing even more of your tooth.

Cerec is new concept. With CEREC we can make a crown, filling or anything in-between to suit your tooth, here in the practice in about an hour.

We take a picture of your tooth and on the specialised computer system design your restoration, and make it from a solid block of porcelain.

It's bonded into place using a strong dental adhesive, leaving you with a great looking, stronger tooth in a single appointment
